Each LAMP survey route has 10 stops, and the goal is to visit all 10 stops on the same night during each of three survey windows. A survey window is a 40-day window of time corresponding to “winter”, “spring”, and “summer” call surveys of the route. A complete survey in a given year will have 30 observations. This table lists LAMP routes with one or more observations from 1997-2017. In some years one or two survey windows, or one or more stops may not have been observed.

Blank cells indicate no observations for that year.
