**RANA BEDRIAGAE** (Bedriaga's Frog). MALTA: GOZO ISLAND: L-Ghadira ta' Sarraflu (36°02'3"N; 14°12'2"E). 500 m elev. 5 September 2004. Jonathan Abela, Nimrod Mifsud, Esther Schembri, Arnold Sciberras, and Jeffery Sciberras. National Museum of Natural History, Mdina, Malta (NMNH AN01105). Verified by Ulrich Sinsch, Universität Bonn (on the basis of color photographs and recordings of advertisement calls). Introduced to the Maltese Islands, where *Discoglossus pictus pictus* is the only native amphibian (Baldacchino and Schembri 2002. *Amfibiji, Rettili, u Mammiferi fil-gzejjer Maltin*. Il-Pjeta, Publikazzjonijiet Indipendenza, xii + 256 pp., Malta; Lanza 1972. *Lav. Soc. Ital. Biogeogr. N. Ser.*, 3:755–804). Calls were first heard from the permanent freshwater pool at Ta' Sarraflu in April 2000, when approximately six individuals were calling. Individuals were first seen on 27 May 2004. Since then, choruses of at least 50 frogs have been heard around the pool. Eggs, tadpoles, and froglets were seen there, indicating successful reproduction. Choruses are now heard at two other localities on Gozo Island, indicating that the species is spreading.

**RANA BERLANDIERI** (Rio Grande Leopard Frog). MEXICO: SONORA: 13 km SW San Luis Río Colorado, 30 m E Hwy 40 (32°24'34.1"N, 114°52'52.5"W), 27 m elev. 9 April 2005. James C. Rorabaugh and Jeffrey M. Servoss. Verified by T. Brennan. Arizona State University voucher photographs (ASU HP-00020–21). First records from Sonora; the closest accounts are from adjacent portions of Baja California Norte, Mexico and Arizona, USA (Grismer 2002. *Amphibians and Reptiles of Baja California: Including Its Pacific Islands and the Islands in the Sea of Cortez*. Univ. of California Press, Berkeley. 399 pp.; Rorabaugh et al. 2002. *Southwest. Nat.* 47:12–20). This Sonoran population most likely originated by means of invaders from southwestern Arizona (Platz et al. 1990. *Copeia* 1990:324–333), using the Río Colorado or agricultural canals as dispersal routes. Both specimens were observed in a concrete-lined ditch in an agricultural area within the valley of the Río Colorado.

Submitted by **JAMES C. RORABAUGH** (e-mail: Jim\_Rorabaugh@fws.gov) and **JEFFREY M. SERVOSS**, U.S. Fish and Wildlife Service, 2321 West Royal Palm Road, Suite 103, Phoenix, Arizona 85021, USA.

**RANA CASCADAE** (Cascades Frog). USA: WASHINGTON: JEFFERSON CO.: 47°47.56'N, 124°23.80'W, 98 m elev. 17 March 2005. R. O'Donnell and J. MacCracken. Voucher photographs in the University of Washington Burke Museum (UWBM 2131–2133). Verified by Marc P. Hayes. Thirteen egg masses were found in a ca. 2–3 m 15 cm deep puddle with a mud/silt substrate at the junction of two logging roads. Embryos ranged from stage 14 to 24, including two egg masses that had begun to hatch (Gosner 1960. *Herpetologica* 16:183–190). A brief search of the surrounding area did not reveal any adults. JEFFERSON CO.: N47°50.68', W124°22.87', 109 m elev. 3 May 2005. R. O'Donnell, L. Beatty,

and R. McGinnis. Voucher photograph in the University of Washington Burke Museum (UWBM 2134). Verified by Marc P. Hayes. One juvenile found near a stream at a washed-out crossing of a decommissioned logging road. *Rana cascadae* is generally considered a species of high elevations. These observations represent new published low elevation records for the species by over 120 m (Stebbins 2003. *Western Reptiles and Amphibians*, 3rd ed. Houghton Mifflin Company, Boston, 533 pp.). However, several museum specimens are available from low elevations on the western side of the Olympic Peninsula which have not been reported in the literature from 167 m (MVZ 65571), ca. 100 m (PSM 1458), and ca. 73 m (CAS 47708–47723). The new records reported here provide needed recent confirmation of low-elevation records from the Olympic Peninsula which have not been reported since the 1910s, where the species had been thought to be extirpated (Leonard et al. 1993. *Amphibians of Washington and Oregon*. Seattle Audubon Society, Seattle, 168 pp.; McAllister 1995. *Northwest Fauna* 3:81–112).
